Inspection

Type: ROUTINE INSPECTION

Date: JUN-21-2007

1010 MIRACLE STRIP PKWY, SE
FT WALTON BEACH, FL 32548

3.101 (b)

3.101 (d) REPEAT NC!

FACILITIES, GENERAL

NOTE: This item was documented on inspection of May 22, 2007 and has time remaining on its documented completion date.

(b) Water and power supply. Reliable and adequate sources of water and electric power must be provided by the facility housing marine mammals. Written contingency plans must be submitted to and approved by the Deputy Administrator regarding emergency sources of water and electric power in the event of failure of the primary sources, when such failure could reasonably be expected to be detrimental to the good health and well-being of the marine mammals housed in the facility. Contingency plans must include, but not be limited to, specific animal evacuation plans in the event of a disaster and should describe back-up systems and/or arrangements for relocating marine mammals requiring artificially cooled or heated water. If the emergency contingency plan includes release of marine mammals, the plan must include provision for recall training and retrieval of such animals.

*** There is no written contingency plan. Procedures are in place but a formal written plan has not been developed and approved. A written plan shall be developed, approved and maintained on hand. To be corrected by June 30, 2007.

(d) Storage. Supplies of food must be stored in facilities that adequately protect such supplies from deterioration, spoilage (harmful microbial growth), and vermin or other contamination. Refrigerators and freezers (or chilled and/or iced coolers for under 12 hours) must be used for perishable food. No substances that are known to be or may be toxic or harmful to marine mammals may be stored or maintained in the marine mammal food storage or preparation areas, except that cleaning agents may be kept in secured cabinets designed and located to prevent food contamination. Food, supplements, and medications may not be used beyond commonly accepted shelf life or date listed on the label.

***The food previously documented as exposed at the entrance to the freezer has been removed. The new shipment of feed has been stacked in the freezer in a manner that blocks entrance into the cooler thereby prohibiting inspection. Stacking food too closely can increase the risk of contamination, freezer burn or improper freezing. The pallets shall be stored in a manner that will allow access into the freezer to inspect the food and storage area and protect the food from contamination.

3.107 (c)

REPEAT NCI

SANITATION.

(c) Housekeeping. Buildings and grounds, as well as exhibit areas, must be kept clean and in good repair. Fences must be maintained in good repair. Primary enclosures housing marine mammals must not have any loose objects or sharp projections and/or edges which may cause injury or trauma to the marine mammals contained therein.

***The dead seagull that was in the off exhibit area near the walkway around the rookery has been removed but the trash and debris has not been removed. The area between the offices and freezer is being used for construction. There are construction items (old wood, pipes, metal) and other items stored on the ground creating clutter. The area around the IA building has overgrown weeds. There is wood and construction material thrown down the hill. Poor housekeeping increases the risk of problems with pest control and contamination. All areas shall be cleaned and items properly stored.

NOTE: The trash and debris around the rookery was removed by the end of this inspection.

The following noncompliances documented on the last inspection of May 22, 2007 have been corrected:

Section 2.40 (b)(3)
Section 2.75 (b)(1)
Section 3.101 (a)
Section 3.103 (b)
Section 3.109
Section 3.125 (a)
